Newsletter of the  
Troop of Reputed Tortricid Systematists

## **ANNUAL MEETING OF LEPIDOPTERISTS' SOCIETY AT McGUIRE CENTER**

The annual meeting of the Lepidopterists' Society was held 15-18 June 2006, at the new McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida, USA. The meeting was co-hosted by the Lepidopterists' Society, the Southern Lepidopterists' Society, and the Association for Tropical Lepidoptera. It was attended by over 150 lepidopterists from the U.S., Canada, Mexico, several South American countries, several European countries (e.g., Spain, Denmark, Switzerland, Germany), and a couple Asian countries (Japan, Taiwan). The meeting provided many of us with our first glimpse of the McGuire Center, touted to be the future center for Lepidoptera research in North America.

The meeting program included contributed papers, posters, symposium, and workshops. There were 16 student presentations, reflecting the continued increase in the level of student participation at the meetings. Among the informal workshops was a gathering of noctuid specialists, lead by Don Lafontaine and Michael Fibiger, who discussed homologies among genital structures across the superfamily. There also were workshops on the Lepidoptera

Tree of Life Project (led by Charles Mitter and Cyndy Parr) and the DNA-barcode Project (led by Paul Hebert).

Numerous "members" of TORTS were present, including Joaquin Baixeras, John Brown, Richard Brown, Soowon Cho, Jason Dombroskie, Todd Gilligan, Bernard Landry, Jean-François Landry, William Miller, Dan Rubinoff, Felix Sperling, Shen-Horn Yen, and possibly others I did not recognize.

The international flavor of the meeting was stimulating and likely will provide an incentive for many North American lepidopterists to consider attending the SEL meeting in Berlin in 2007.

---

## **PASSING OF I. F. B. COMMON**

The following correspondence was received by many from CSIRO:

"Dear Colleagues,

It is with great sadness that we have to let you know that Dr Ian Common died in his sleep early this morning (3 June), just a few days before his 89th birthday. He had been professionally active until recently, going on regular collecting trips with his wife Jill.

Ian was one of the most outstanding lepidopterists of our time, not only single-handedly laying the foundation for our understanding of the vast and diverse Australian

fauna but producing seminal studies of world-wide relevance each time he monographed a group. His early research made major contributions towards resolving the taxonomy of many important Lepidoptera pests in Australia. His 1954 paper on the biology of the bogong moth is a classic study on insect migration, elucidating an iconic Australian phenomenon. Some of Ian's most remarkable contributions include the study of the primitive family Lophocoronidae, and the families Anthelidae and Carthaeidae. However, his primary research contributions were concerned with the Tortricinae and Oecophorinae. Based on revisions of Australian groups, Ian made very significant contributions to tortricine systematics and phylogeny relevant well beyond Australia. His single most outstanding achievement is the complete overview of the genera of the Australian Oecophorinae, with some 5000 species in 250 genera the largest family group of Australian Lepidoptera. This three-volume work gives access to one of the largest Australian radiations. Ian's broad and scholarly knowledge of Lepidoptera systematics was summarised in the chapters in *The Insects of Australia* and his 1975 review of the evolution and classification of the Lepidoptera, texts which have inspired lepidopterists around the world.

Ian has always shared his vast knowledge most generously with colleagues as well as with serious amateur naturalists. From the two small Jacaranda pocket guides on Australian moths and butterflies to the comprehensive volumes *Butterflies of Australia* and *Moths of Australia*, he produced extensive contributions which served as textbooks for systematists and as 'bibles' for enthusiasts. Both volumes reflect Ian's unrivalled knowledge of Australian moth biology.

Unlike many of us, Ian managed to put on paper a remarkable proportion of his knowledge in scholarly research publications and of his rich field experience in books, much of it written after retirement.

Although Ian achieved international fame for his work on the higher classification and his revisionary studies, in addition to all this he build up the outstanding Lepidoptera holdings in the ANIC. The collection with its extremely high standard of preservation and curatorial practice is a testimony to Ian's dedication and industry.

Together with colleagues, in particular Murray Upton and Ted Edwards, he undertook a large number of major field expeditions and has continued his tireless efforts in collecting after his retirement until shortly before his death. The arrival at the ANIC of moths collected by Ian always had the feel of opening Christmas parcels.

Ian's status as one of the foremost lepidopterists was acknowledged with numerous honours. He won the Royal Zoological Society of New South Wales' Whitley Medal in 1991 for 'Moths of Australia' for the 'best book on the natural history of Australian animals'. In 1996 he was awarded the Karl Jordan Medal by the Lepidopterists' Society, and in 2001 he was made an Officer of the Order of Australia.

Ian will be missed not only as an exceptional scientist but also as a wonderful colleague and friend. Anybody who has worked with him will remember his quiet but wicked sense of humour, and in his close collaborators this generous, thoughtful scholar inspired the loyalty of a family. His wife Jill's unstinting support throughout his career was a major factor in making all his achievements possible."

Marianne Horak & Ted Edwards - CSIRO

## **INITIATIVE FOR DEVELOPING A COLLECTION FOR MOLECULAR ANALYSES**

Through my involvement in the Lepidoptera Tree-of-Life project, it has become clear that there is precious little material of Tortricidae available for molecular analyses (i.e., frozen tissue samples), and there is no major depository where frozen specimens can be deposited and/or borrowed by researchers worldwide. It also has become clear that molecular analyses are going to be critical for elucidating relationships among the higher level categories (i.e., subfamilies and tribes) within Tortricidae. Hence, development of a collection of frozen specimens is long overdue. Just as our predecessors accumulated material in the collections we use today, we are obligated to gather specimens for those that follow us.

In association with the Tree-of-Life project, a small collection of mostly North American Tortricidae (about 50 species representing all North American tribes) has been assembled at the University of Maryland, and we propose that this collection function as the nucleus for a larger, worldwide collection of specimens suitable for molecular studies. It is our hope that this larger collection will be assembled by and utilized by collaborators throughout the world. Hence, we are soliciting your input regarding your interest in the project, along with comments on its feasibility.

Optimally, multiple specimens of each species should be available in case different researchers request the same species for different projects. However, for some tribes and/or genera that are rare or difficult to obtain, we will have to be particular about how the

material is dispersed. In situations where only a single specimen is available in the collection, extract aliquots may be distributed rather than the specimen itself. We will work with individuals to try to distribute fairly material under these circumstances.

For information on this initiative, check out the new website being developed by Todd Gilligan - <http://www.tortricidna.org>. If you have questions, suggestions, recommendations, or other comments, please feel free to contact John Brown ([jbrown@sel.barc.usda.gov](mailto:jbrown@sel.barc.usda.gov)) or Todd Gilligan ([tgilliga@columbus.rr.com](mailto:tgilliga@columbus.rr.com)).

---

## **TORTRICID CATALOG TO BE CONVERTED INTO DATABASE FORMAT**

Joaquin Baixeras, our colleague at the University of Valencia, Spain, has been hard at work converting the tortricid catalog into a database format. The short-term goals are to assemble a comprehensive database of all the names used in Tortricidae, correction conspicuous mistakes in the hard copy of the catalog, continue to add new taxa as they are published, and continue to update the database as new combinations and other taxonomic changes are proposed. You can help facilitate this effort by sending corrections and reprints of new papers to John Brown ([jbrown@sel.barc.usda.gov](mailto:jbrown@sel.barc.usda.gov)).

The long-term goals are to make the database available via the web and to add fields for geographic distribution of all species, food plants (along with references), and references to illustrations of the adults and genitalia.

Joaquin promises to keep us posted as progress is made.
